

Question 1 — Science (5 marks)

The question asks us to explain how a simple electric circuit works and to illustrate the explanation with a properly labelled circuit diagram. This is a very important topic in physics and it is used in many places in daily life, such as in homes, in schools, in offices and in industries. Without circuits, modern life would not be possible at all.

A simple electric circuit consists of several components. These components include a battery, a switch, a bulb, a resistor, an ammeter and a voltmeter. Each of these components has its own function and all of them are important. If any one of them is missing the circuit will not work in the proper way.

The current flows in the circuit and this flow of current is what makes the bulb glow. The battery is the source of the electricity. The switch is used for switching. The resistor is used for resistance. The ammeter and the voltmeter are the measuring instruments of the circuit and they are used for measurement purposes.

Therefore we can conclude that a simple electric circuit is a very useful arrangement and all the components must be connected properly for the circuit to work correctly.

Question 2 — English (5 marks)

Technology has made information easier to access, but easier access to information does not necessarily mean better learning. This statement is a very important statement and it makes us think deeply about the role of technology in the field of education in the present day scenario.

There are two sides to every coin. On the one hand, technology is very useful and helpful for the students. On the other hand, technology can also be harmful if it is not used in the correct manner. Different people have different opinions about this matter and both the opinions have their own value.

Many students today are using technology for their studies. They use mobile phones, laptops, tablets and computers. All of these devices are very advanced and they contain a lot of information which was not available to students in the earlier times.

In conclusion, I would like to say that technology is a double edged sword and students should use it wisely and carefully for their own benefit and for the benefit of society as a whole.

Question 3 — Economics (5 marks)

The table given in the question shows the price of the product and the quantity demanded and the quantity supplied at each price. We have to draw the demand and supply graph using this data and then explain what the graph tells us about the market.

From the graph we can see the demand curve and the supply curve. The demand curve is showing the demand and the supply curve is showing the supply. Where they meet is a very important point in economics and it tells us a lot about the market condition.

The market is affected by many factors such as the price, the cost of production, the behaviour of consumers and the behaviour of producers. All these factors together decide what happens in the market at any given time.
