Question 1 — Science (5 marks)

A circuit is a closed path where current flows from the battery through the wires. The switch is used to turn it on and off.

~~The ammeter is connected~~

Question 2 — English (5 marks)

I think the statement is largely true. Finding information has become easy, but understanding it has not become any easier, and those two things get confused.

Technology genuinely helps when a student is trying to understand. If a textbook explanation does not work, a video or a simulation might. My younger brother could not understand fractions from the book at all, but an app that cut a shape into pieces made it obvious to him in one evening.

The problem is that the same access lets a student skip the thinking entirely. If the answer to every homework question is a search away, the homework stops doing its job, which was to make you practise. Someone could argue that this is the student's fault and not technology's, and there is something in that, but a tool that makes the shortcut effortless does share the blame.

So I would say technology improves access and only sometimes improves learning, and the difference is whether the student is using it to understand or to finish.

Question 3 — Economics (5 marks)
