

Question 1 — Science (5 marks)

A circuit is a closed path for current. The battery gives the voltage and the switch opens and closes the circuit. When the switch is closed the current flows through the bulb and the resistor and the bulb lights up. When it is open nothing flows.

I have drawn the battery, switch, resistor and bulb in one loop. The ammeter and the voltmeter are also shown in the diagram.

If the resistance is increased the current becomes less because the resistance opposes the flow of current.

Fig 1 — Circuit**Question 2 — English (5 marks)**

Technology has made learning much easier for students. Everything is available on the internet now, so if you do not understand something in class you can just look it up at home. There are videos, notes and websites for every subject and they are mostly free.

For example, a student who misses school because of illness can still catch up with the lessons by watching recordings. Earlier this was not possible and the student would simply fall behind.

So I think technology has helped students learn better than before.

Question 3 — Economics (5 marks)

The demand curve goes downward and the supply curve goes upward. They meet at Rs 30 and 60 units, which is the equilibrium point because at that price the quantity demanded and the quantity supplied are the same.

~~If the price is Rs 20 the supply is more than the demand~~

When the price is below the equilibrium the demand is more than the supply, so there is a shortage of goods in the market. When the price is above the equilibrium there is a surplus because too much is produced.

Fig 2 — Demand and supply graph
