

Question 1 — Science (5 marks)

A circuit is a path made of wires where electricity travels from one end of the battery to the other. The battery stores the current inside it and releases it when the switch is pressed.

The voltmeter should be connected in series with the bulb so that all the voltage passes through it and can be measured properly. The ammeter I have connected across the wire so that it can catch the current going past.

If we increase the resistance in the circuit then the current increases, because the resistor pushes the current forward and makes the bulb brighter. This is why bigger resistors are used in bright lights.

Question 2 — English (5 marks)

Technology is very good and it is the future. Everybody uses technology today and it has made everything better. Students should use technology because it is modern and fast.

Therefore technology is good for learning and all schools should use it.

Question 3 — Economics (5 marks)

From the table the equilibrium is at Rs 10 and 100 units, because that is the row where the demand is the highest. Equilibrium means the point where the buyers are the most happy.

If the price goes below the equilibrium there will be a surplus because nobody wants to buy at a low price. If the price goes above it there will be a shortage because the sellers keep the goods with them.

If the cost of production increases the supply curve will shift to the right because the company has to sell more units to cover the cost, and the price will come down.
