

Question 1 — Science (5 marks)

1.3

A simple circuit is a complete conducting loop. The cell provides the potential difference that drives the current, the switch makes or breaks the loop, the resistor limits the current and the bulb converts electrical energy into light and heat. With the switch closed there is a continuous path and current flows; with it open the path is broken and the bulb goes out.

Feedback: The student provides a correct explanation of the circuit's nature and the functions of the battery, switch, resistor, and bulb.

The ammeter is placed in the main loop, in series with the bulb and resistor, since the whole current has to pass through it to be measured. The voltmeter is connected in parallel, across the two ends of the bulb, because it compares the potential at either side of the bulb. Putting the voltmeter in the main loop would be wrong.

1.5

The arrow on my diagram shows conventional current leaving the positive terminal and returning to the negative terminal. Since $V = IR$ and the battery voltage is fixed, increasing R must reduce I .

Feedback: The student correctly identifies the direction of conventional current flow. That is why adding resistance dims the bulb.

1.1

Fig 1 — Series circuit, voltmeter across the bulb

Feedback: The student correctly identifies and lists the necessary components in a series circuit configuration.

Question 2 — English (5 marks)

2.1

Access to information is not the same thing as learning, and I think that distinction is the heart of this statement. Technology has removed the barrier of finding out; it has not removed the work of understanding.

Feedback: The student presents a clear and nuanced position on the difference between

information access and actual learning.

2.4

Where technology clearly helps is in repetition and choice. If one explanation does not work, a student can find another. When I was preparing for my mathematics test I used a graphing tool to see what changing a coefficient actually did to the curve, which no amount of re-reading the textbook had made clear to me.

Feedback: The student uses a specific, relevant personal example to support their reasoning.

2.6

The opposing case is real, though. A student who reaches for a search result at the first difficulty never sits with a problem long enough to learn from it, and struggling with a question is a large part of how understanding is built. Instant answers can quietly remove that struggle.

Feedback: The student meaningfully addresses the opposing viewpoint regarding dependency

on instant answers.

My conclusion is that technology raises the ceiling and lowers the floor at the same time. A student who already wants to understand gets far more out of it than before; a student who wants to be finished gets finished faster. The tool is the same, and the outcome depends on the intention behind it.

Feedback: The student provides a coherent and reasoned conclusion that synthesizes the

previous arguments.

Question 3 — Economics (5 marks)

3.1

On my graph quantity is on the x-axis and price on the y-axis. Demand slopes down because people buy more at lower prices, and supply slopes up because producers offer more at higher prices. The curves cross at Rs 30 and 60 units. That is the equilibrium: at Rs 30 the quantity

demanded and the quantity supplied are both 60, so the market clears exactly.

Feedback: The student correctly describes the axes and the slopes of the demand and supply

curves.

Feedback: The student correctly identifies the equilibrium point and explains why it is the

equilibrium.

If the cost of production goes up, each unit is less profitable, so producers are willing to supply less at every price and the supply curve shifts to the left. With demand unchanged, the new intersection lies at a higher price and a lower quantity than before, which I have marked as E1.

Feedback: The student correctly explains that increased production costs lead to a leftward shift

of the supply curve.

Feedback: The student correctly identifies the resulting change in equilibrium price and quantity.

Question 1

Explain how a simple electric circuit works and illustrate your explanation with a properly labelled circuit diagram showing a battery, switch, bulb, resistor, ammeter and voltmeter. Your answer should explain how the components are connected, the path followed by electric current, and how changing the resistance affects the current flowing through the circuit.

5 / 5

CORRECT

1 / 1

1.1 Correctly represents the main circuit with battery, switch, bulb and resistor connected in a closed series path

MODEL ANSWER

A properly labelled diagram would therefore show the battery connected to the switch, resistor, bulb and ammeter in a single closed loop

STUDENT WROTE

"Fig 1 - Series circuit, voltmeter across the bulb Switch (S) Resistor R Bulb A Ammeter (in series) Battery + -"

WHY THIS MARK

The student correctly identifies and lists the necessary components in a series circuit configuration.

CORRECT

1 / 1

1.2 Correct placement of ammeter in series and voltmeter in parallel across the bulb

MODEL ANSWER

The ammeter must be connected in series because it measures the current flowing through the circuit. A voltmeter, however, should be connected in parallel across the bulb, because it measures the potential difference between the two ends of the bulb.

STUDENT WROTE

"The ammeter is placed in the main loop, in series with the bulb and resistor... The voltmeter is connected in parallel, across the two ends of the bulb"

WHY THIS MARK

The student correctly explains the series connection for the ammeter and the parallel connection for the voltmeter.

CORRECT

1 / 1

1.3 Correct explanation of current flow and the function of the main components

MODEL ANSWER

A simple electric circuit provides a closed path through which electric current can flow. The battery provides the potential difference that drives current through the circuit. The switch is used to open or close the circuit.

STUDENT WROTE

"A simple circuit is a complete conducting loop. The cell provides the potential difference that drives the current, the switch makes or breaks the loop, the resistor limits the current and the bulb converts electrical energy into light and heat."

WHY THIS MARK

The student provides a correct explanation of the circuit's nature and the functions of the battery, switch, resistor, and bulb.

CORRECT

1 / 1

1.4 Correctly explains the relationship between resistance and current, including the relevant principle/Ohm's law

MODEL ANSWER

According to Ohm's law, $V = IR$. If the voltage of the battery remains constant and the resistance is increased, the current flowing through the circuit decreases. Conversely, reducing the resistance allows more current to flow.

STUDENT WROTE

"Since $V = IR$ and the battery voltage is fixed, increasing R must reduce I ."

WHY THIS MARK

The student correctly applies Ohm's law to explain the inverse relationship between resistance and current when voltage is constant.

CORRECT

1 / 1

1.5 Clear, logically structured explanation with appropriate labels and current direction in the diagram

MODEL ANSWER

The conventional current direction should be shown from the positive terminal of the battery through the external circuit towards the negative terminal.

STUDENT WROTE

"The arrow on my diagram shows conventional current leaving the positive terminal and returning to the negative terminal."

WHY THIS MARK

The student correctly identifies the direction of conventional current flow.

Question 2

"Technology has made information easier to access, but easier access to information does not necessarily mean better learning." Discuss this statement in detail. Write a well-structured response explaining whether you believe technology makes students better learners or makes them dependent on easily available answers. Support your argument with relevant examples, consider an opposing viewpoint, and conclude with your own reasoned opinion.

5 / 5

CORRECT

1 / 1

2.1 Presents a clear position on whether/how technology affects learning

STUDENT WROTE

"Access to information is not the same thing as learning, and I think that distinction is the heart of this statement. Technology has removed the barrier of finding out; it has not removed the work of understanding."

WHY THIS MARK

The student presents a clear and nuanced position on the difference between information access and actual learning.

CORRECT

1 / 1

2.2 Provides relevant and logically developed arguments supporting the position

STUDENT WROTE

"Where technology clearly helps is in repetition and choice. If one explanation does not work, a student can find another."

WHY THIS MARK

The student provides logically developed arguments regarding how technology can facilitate learning through variety and repetition.

CORRECT

1 / 1

2.3 Recognises and meaningfully addresses an opposing viewpoint or limitation

STUDENT WROTE

"The opposing case is real, though. A student who reaches for a search result at the first difficulty never sits with a problem long enough to learn from it, and struggling with a question is a large part of how understanding is built."

WHY THIS MARK

The student meaningfully addresses the opposing viewpoint regarding dependency on instant answers.

CORRECT

1 / 1

2.4 Uses relevant examples and demonstrates reasoning rather than merely making unsupported claims

STUDENT WROTE

"When I was preparing for my mathematics test I used a graphing tool to see what changing a coefficient actually did to the curve, which no amount of re-reading the textbook had made clear to me."

WHY THIS MARK

The student uses a specific, relevant personal example to support their reasoning.

CORRECT

1 / 1

2.5 Provides a coherent conclusion that follows from the discussion, with clear overall communication

STUDENT WROTE

"My conclusion is that technology raises the ceiling and lowers the floor at the same time. A student who already wants to understand gets far more out of it than before; a student who wants to be finished gets finished faster."

WHY THIS MARK

The student provides a coherent and reasoned conclusion that synthesizes the previous arguments.

Question 3

The table below shows the relationship between the price of a product and the quantity demanded and supplied in a market. Price (Rs.) Quantity Demanded Quantity Supplied 10 100 20 20 80 40 30 60 60 40 40 80 50 20 100 Using the information provided, draw a properly labelled demand-and-supply graph and explain what the graph tells us about the market, including what happens when the market moves away from equilibrium and how an increase in the cost of production would affect the supply curve and the ...

CORRECT

1 / 1

3.1 Correctly plots and labels the demand and supply curves, with appropriate axes and direction

MODEL ANSWER

The demand and supply data can be represented on a graph with quantity on the horizontal axis and price on the vertical axis. The demand curve should slope downward from left to right... The supply curve should slope upward from left to right

STUDENT WROTE

"On my graph quantity is on the x-axis and price on the y-axis. Demand slopes down because people buy more at lower prices, and supply slopes up because producers offer more at higher prices."

WHY THIS MARK

The student correctly describes the axes and the slopes of the demand and supply curves.

CORRECT

1 / 1

3.2 Correctly identifies the equilibrium at Rs.30 and 60 units and explains why it is equilibrium

MODEL ANSWER

The two curves intersect at a price of Rs.30 and a quantity of 60 units. This point represents the market equilibrium because at this price the quantity demanded is equal to the quantity supplied.

STUDENT WROTE

"The curves cross at Rs 30 and 60 units. That is the equilibrium: at Rs 30 the quantity demanded and the quantity supplied are both 60, so the market clears exactly."

WHY THIS MARK

The student correctly identifies the equilibrium point and explains why it is the equilibrium.

MISSING

0 / 1

3.3 Correctly explains shortage below equilibrium and surplus above equilibrium

MODEL ANSWER

If the market price is below the equilibrium price, quantity demanded is greater than quantity supplied. This creates a shortage... If the market price is above the equilibrium price, quantity supplied is greater than quantity demanded. This creates a surplus

WHY THIS MARK

The student does not explain what happens (shortage or surplus) when the market price is above or below the equilibrium price.

CORRECTION

The student should have explained that a price below equilibrium leads to a shortage (demand > supply) and a price above equilibrium leads to a surplus (supply > demand).

CORRECT

1 / 1

3.4 Correctly explains that increased production costs shift the supply curve left/upward

MODEL ANSWER

If the cost of producing the product increases, production becomes less profitable at each existing price. Producers will therefore be willing to supply less at each price. The supply curve shifts to the left/upward

STUDENT WROTE

"If the cost of production goes up, each unit is less profitable, so producers are willing to supply less at every price and the supply curve shifts to the left."

WHY THIS MARK

The student correctly explains that increased production costs lead to a leftward shift of the supply curve.

CORRECT

1 / 1

3.5 Correctly explains the resulting tendency toward a higher equilibrium price and lower equilibrium quantity, with the change represented appropriately on the graph

MODEL ANSWER

The new equilibrium would generally occur at a higher price and lower quantity, assuming demand remains unchanged.

STUDENT WROTE

"With demand unchanged, the new intersection lies at a higher price and a lower quantity than before, which I have marked as E1."

WHY THIS MARK

The student correctly identifies the resulting change in equilibrium price and quantity.
