

Question 2 — English (5 marks)

Answered out of order — Q2 first, as permitted.

2.1
I disagree with the popular view. I think easy access to information has, on balance, made students worse learners, and I want to argue that carefully rather than just assert it.

Feedback: The student takes a clear and explicit position on the issue.

Learning happens when you hold a difficulty in your head long enough to resolve it. That process is uncomfortable, and every shortcut out of the discomfort is taken. Before search engines, a student stuck on a problem had no option but to reread, reason and ask. Now the exit is one tap away, and the exit is always taken first. What is practised is retrieval of somebody else's reasoning, not the construction of your own.

2.4
I have watched this in my own class. When we were given a set of unseen problems, most of us including me found worked solutions online within minutes and copied the method. In the test two weeks later, where nothing could be looked up, the same problems were much harder than they should have been. We had read the solutions; we had not learned to produce them.

Feedback: The student uses a relevant personal example to illustrate the difference between

retrieving a solution and learning a method.

5.3
The strongest argument against my position is that technology gives access to students who would otherwise have none — a student without a good teacher can now find an excellent explanation for free. I accept that this is a genuine and important gain, and for a motivated student it is

transformative. But that student is exactly the one who would have found a way regardless. For the

ordinary student, the same tool mostly removes the need to think.

2.5
So my conclusion is that the technology is not neutral in practice, even if it is neutral in principle. It reliably reduces the amount of struggle in a student's day, and since struggle is where learning comes from, it has made most students worse learners even while making them better informed.

Feedback: The conclusion is coherent, summarizes the main argument, and follows logically from the discussion.

Question 1 — Science (5 marks)

1.3

A circuit is a closed loop of conductors. The battery supplies the potential difference, the switch completes or breaks the loop, and current flows through the resistor and the bulb only when the loop is complete. The ammeter is in the loop itself, in series, because the same current flows through every series component. The voltmeter goes across the bulb in parallel, since it measures the difference in potential between the bulb's two ends.

Feedback: The student provides a correct explanation of the circuit's function and the roles of the battery and switch.

the difference in potential between the bulb's two ends.

Feedback: The student correctly explains and places the ammeter in series and the voltmeter in parallel.

Increasing the resistance reduces the current, because for a fixed voltage $I = V/R$.

Feedback: The student correctly identifies the inverse relationship between resistance and current and cites the relevant formula (Ohm's Law).

1.5

Feedback: The student correctly identifies the necessary components and describes them as the diagram of a circuit diagram.

Correction: The student should have specified that conventional current flows from the positive terminal of the battery to the negative terminal.

Question 3 — Economics (5 marks)

Price is on the vertical axis, quantity on the horizontal. Demand slopes downward, supply slopes upward, and the two cross at Rs 30 and 60 units. At that price quantity demanded equals quantity supplied, which is why it is the equilibrium.

Feedback: The student correctly identifies the equilibrium point and explains it based on the equality of demand and supply.

Below Rs 30 buyers want more than sellers will supply, so there is a shortage and the price is bid up. Above Rs 30 sellers bring more than buyers want, so there is a surplus and the price is cut. In both cases the market is pushed back towards Rs 30.

Feedback: The student correctly explains the concepts of shortage and surplus when the market is away from equilibrium.

3.4

A rise in production costs makes supplying less profitable at every price, so the supply curve shifts left. The new equilibrium sits higher up the demand curve: a higher price and a smaller quantity traded.

Feedback: The student correctly explains that increased production costs lead to a leftward shift of the supply curve.

Feedback: The student correctly identifies the resulting higher equilibrium price and lower equilibrium quantity.

14.5 / 15 (96.7%)

Flagged for human review - confirm these marks before releasing them.

Question 1

Explain how a simple electric circuit works and illustrate your explanation with a properly labelled circuit diagram showing a battery, switch, bulb, resistor, ammeter and voltmeter. Your answer should explain how the components are connected, the path followed by electric current, and how changing the resistance affects the current flowing through the circuit.

4.5 / 5

CORRECT

1 / 1

1.1 Correctly represents the main circuit with battery, switch, bulb and resistor connected in a closed series path

MODEL ANSWER

A properly labelled diagram would therefore show the battery connected to the switch, resistor, bulb and ammeter in a single closed loop

STUDENT WROTE

"Fig 1 - Circuit Switch (S) Resistor R Bulb A Ammeter (in series) Battery + -"

WHY THIS MARK

The student correctly identifies the necessary components and describes them as being part of a circuit loop.

CORRECT

1 / 1

1.2 Correct placement of ammeter in series and voltmeter in parallel across the bulb

MODEL ANSWER

The ammeter must be connected in series because it measures the current flowing through the circuit. A voltmeter, however, should be connected in parallel across the bulb, because it measures the potential difference between the two ends of the bulb.

STUDENT WROTE

"The ammeter is in the loop itself, in series, because the same current flows through every series component. The voltmeter goes across the bulb in parallel, since it measures the difference in potential between the bulb's two ends."

WHY THIS MARK

The student correctly explains and places the ammeter in series and the voltmeter in parallel.

CORRECT

1 / 1

1.3 Correct explanation of current flow and the function of the main components

MODEL ANSWER

A simple electric circuit provides a closed path through which electric current can flow. The battery provides the potential difference that drives current through the circuit. The switch is used to open or close the circuit.

STUDENT WROTE

"A circuit is a closed loop of conductors. The battery supplies the potential difference, the switch completes or breaks the loop, and current flows through the resistor and the bulb only when the loop is complete."

WHY THIS MARK

The student provides a correct explanation of the circuit's function and the roles of the battery and switch.

CORRECT

1 / 1

1.4 Correctly explains the relationship between resistance and current, including the relevant principle/Ohm's law

MODEL ANSWER

According to Ohm's law, $V = IR$. If the voltage of the battery remains constant and the resistance is increased, the current flowing through the circuit decreases. Conversely, reducing the resistance allows more current to flow.

STUDENT WROTE

"Increasing the resistance reduces the current, because for a fixed voltage $I = V/R$."

WHY THIS MARK

The student correctly identifies the inverse relationship between resistance and current and cites the relevant formula (Ohm's Law).

1.5 Clear, logically structured explanation with appropriate labels and current direction in the diagram**MODEL ANSWER**

The conventional current direction should be shown from the positive terminal of the battery through the external circuit towards the negative terminal.

STUDENT WROTE

"Fig 1 - Circuit Switch (S) Resistor R Bulb A Ammeter (in series) Battery + - V Voltmeter (parallel across bulb)"

WHY THIS MARK

The explanation is clear and labels are provided, but the student failed to indicate the direction of the conventional current in the circuit.

CORRECTION

The student should have specified that conventional current flows from the positive terminal of the battery to the negative terminal.

Question 2

"Technology has made information easier to access, but easier access to information does not necessarily mean better learning." Discuss this statement in detail. Write a well-structured response explaining whether you believe technology makes students better learners or makes them dependent on easily available answers. Support your argument with relevant examples, consider an opposing viewpoint, and conclude with your own reasoned opinion.

5 / 5

CORRECT

1 / 1

2.1 Presents a clear position on whether/how technology affects learning**STUDENT WROTE**

"I think easy access to information has, on balance, made students worse learners"

WHY THIS MARK

The student takes a clear and explicit position on the issue.

CORRECT

1 / 1

2.2 Provides relevant and logically developed arguments supporting the position**STUDENT WROTE**

"Learning happens when you hold a difficulty in your head long enough to resolve it... Now the exit is one tap away, and the exit is always taken first. What is practised is retrieval of somebody else's reasoning, not the construction of your own."

WHY THIS MARK

The student develops a logical argument centered on the necessity of cognitive struggle for genuine learning.

CORRECT

1 / 1

2.3 Recognises and meaningfully addresses an opposing viewpoint or limitation**STUDENT WROTE**

"The strongest argument against my position is that technology gives access to students who would otherwise have none - a student without a good teacher can now find an excellent explanation for free. I accept that this is a genuine and important gain"

WHY THIS MARK

The student identifies a valid opposing viewpoint (democratization of information) and addresses it meaningfully.

CORRECT

1 / 1

2.4 Uses relevant examples and demonstrates reasoning rather than merely making unsupported claims**STUDENT WROTE**

"When we were given a set of unseen problems, most of us including me found worked solutions online within minutes and copied the method. In the test two weeks later, where nothing could be looked up, the same problems were much harder than they should have been."

WHY THIS MARK

The student uses a relevant personal example to illustrate the difference between retrieving a solution and learning a method.

CORRECT

1 / 1

2.5 Provides a coherent conclusion that follows from the discussion, with clear overall communication**STUDENT WROTE**

"So my conclusion is that the technology is not neutral in practice, even if it is neutral in principle. It reliably reduces the amount of struggle in a student's day, and since struggle is where learning comes from, it has made most students worse learners even while making them better informed."

WHY THIS MARK

The conclusion is coherent, summarizes the main argument, and follows logically from the discussion.

Question 3

The table below shows the relationship between the price of a product and the quantity demanded and supplied in a market. Price (Rs.) Quantity Demanded Quantity Supplied 10 100 20 80 40 30 60 60 40 40 80 50 20 100 Using the information provided, draw a properly labelled demand-and-supply graph and explain what the graph tells us about the market, including what happens when the market moves away from equilibrium and how an increase in the cost of production would affect the supply curve and the ...

5/5

CORRECT

1 / 1

3.1 Correctly plots and labels the demand and supply curves, with appropriate axes and direction

MODEL ANSWER

The demand and supply data can be represented on a graph with quantity on the horizontal axis and price on the vertical axis. The demand curve should slope downward from left to right... The supply curve should slope upward from left to right

STUDENT WROTE

"Price is on the vertical axis, quantity on the horizontal. Demand slopes downward, supply slopes upward... Fig 2 - Market equilibrium and a leftward supply shift"

WHY THIS MARK

The student correctly describes the axes and the slopes of the demand and supply curves, and provides a textual representation of the graph.

CORRECT

1 / 1

3.2 Correctly identifies the equilibrium at Rs.30 and 60 units and explains why it is equilibrium

MODEL ANSWER

The two curves intersect at a price of Rs.30 and a quantity of 60 units. This point represents the market equilibrium because at this price the quantity demanded is equal to the quantity supplied.

STUDENT WROTE

"the two cross at Rs 30 and 60 units. At that price quantity demanded equals quantity supplied, which is why it is the equilibrium."

WHY THIS MARK

The student correctly identifies the equilibrium point and explains it based on the equality of demand and supply.

CORRECT

1 / 1

3.3 Correctly explains shortage below equilibrium and surplus above equilibrium

MODEL ANSWER

If the market price is below the equilibrium price, quantity demanded is greater than quantity supplied. This creates a shortage... If the market price is above the equilibrium price, quantity supplied is greater than quantity demanded. This creates a surplus

STUDENT WROTE

"Below Rs 30 buyers want more than sellers will supply, so there is a shortage and the price is bid up. Above Rs 30 sellers bring more than buyers want, so there is a surplus and the price is cut."

WHY THIS MARK

The student correctly explains the concepts of shortage and surplus when the market is away from equilibrium.

CORRECT

1 / 1

3.4 Correctly explains that increased production costs shift the supply curve left/upward

MODEL ANSWER

If the cost of producing the product increases, production becomes less profitable at each existing price. Producers will therefore be willing to supply less at each price. The supply curve shifts to the left/upward

STUDENT WROTE

"A rise in production costs makes supplying less profitable at every price, so the supply curve shifts left."

WHY THIS MARK

The student correctly explains that increased production costs lead to a leftward shift of the supply curve.

CORRECT

1 / 1

3.5 Correctly explains the resulting tendency toward a higher equilibrium price and lower equilibrium quantity, with the change represented appropriately on the graph

MODEL ANSWER

The new equilibrium would generally occur at a higher price and lower quantity, assuming demand remains unchanged.

STUDENT WROTE

"The new equilibrium sits higher up the demand curve: a higher price and a smaller quantity traded."

WHY THIS MARK

The student correctly identifies the resulting higher equilibrium price and lower equilibrium quantity.
