Question 1 — Science (5 marks)

1.3

A simple electric circuit is a closed conducting path. The battery gives the potential difference that drives the current round the loop, and the switch opens or closes that path.

Feedback: The student provides a correct explanation of the circuit as a closed path and the

roles of the battery and switch.

The battery, switch, resistor, bulb and ammeter are joined in one loop, that is in series. The ammeter must be in series as the same current passes through every series component. The

voltmeter is joined in parallel across the bulb, since it measures the potential difference between the two ends of the bulb.

1.5

Conventional current moves from the positive terminal of the battery round the external circuit and back to the negative terminal. By Ohm's law $V = IR$, so raising the resistance at a fixed voltage must

lower the current.

Feedback: The student correctly describes the direction of conventional current and provides a

structured explanation with labels.

Feedback: The student correctly applies Ohm's law to explain the inverse relationship between

resistance and current at a constant voltage.

Question 2 — English (5 marks)

2.1
Technology has made information far easier to reach, but reaching information is not the same as learning from it. That distinction is the whole statement in my view.

2.2
Feedback: The student presents a clear position that access to information is distinct from

2.3
learning.
2.4
It helps most where repetition helps: a student can replay an explanation until it lands, or find a

second one when the first does not work. When I could not follow probability in class, three different

2.5
Feedback: The student provides logically developed arguments regarding the benefits of
videos gave me three different angles and one of them finally made sense.

2.6
Feedback: The student uses a relevant personal example to support their reasoning.

2.7
The opposing case is that instant answers remove the struggle, and struggle is where

2.8
understanding is built. A student who locks up every difficult question finishes the work without

2.9
learning from it. I think this is a real risk and not a small one.
Feedback: The student meaningfully addresses the opposing viewpoint that instant answers can hinder deep learning.

2.5

So my conclusion is that technology raises the ceiling and lowers the floor at once. It rewards the

student who wants to understand and it excuses the student who wants to be finished.

Feedback: The student provides a coherent and reasoned conclusion that synthesizes the previous arguments.

Question 3 — Economics (5 marks)

3.1
Quantity is on the horizontal axis and price on the vertical axis. Demand slopes downward, supply

3.2
slopes upward, and they cross at Rs 30 and 60 units, which is the equilibrium because quantity

3.3
demanded equals quantity supplied there.
Feedback: The student correctly describes the axes and the slopes of the demand and supply

3.4
curves.
Feedback: The student correctly identifies the equilibrium point and explains why it is the

3.5
equilibrium.
Below that price there is a shortage and the price is bid up; above it there is a surplus and the price

3.6
is cut. A rise in production cost shifts the supply curve to the left, giving a higher price and a lower

3.7
quantity at the new equilibrium.
Feedback: The student correctly explains the concepts of shortage and surplus relative to supply

3.8
equilibrium.
Feedback: The student correctly explains the resulting change in equilibrium price and quantity.

Question 1

Explain how a simple electric circuit works and illustrate your explanation with a properly labelled circuit diagram showing a battery, switch, bulb, resistor, ammeter and voltmeter. Your answer should explain how the components are connected, the path followed by electric current, and how changing the resistance affects the current flowing through the circuit.

5 / 5

CORRECT

1 / 1

1.1 Correctly represents the main circuit with battery, switch, bulb and resistor connected in a closed series path

MODEL ANSWER

A properly labelled diagram would therefore show the battery connected to the switch, resistor, bulb and ammeter in a single closed loop

STUDENT WROTE

"The battery, switch, resistor, bulb and ammeter are joined in one loop, that is in series."

WHY THIS MARK

The student correctly identifies that the main components are connected in a series loop.

CORRECT

1 / 1

1.2 Correct placement of ammeter in series and voltmeter in parallel across the bulb

MODEL ANSWER

The ammeter must be connected in series because it measures the current flowing through the circuit. A voltmeter, however, should be connected in parallel across the bulb, because it measures the potential difference between the two ends of the bulb.

STUDENT WROTE

"The ammeter must be in series as the same current passes through every series component. The voltmeter is joined in parallel across the bulb"

WHY THIS MARK

The student correctly places the ammeter in series and the voltmeter in parallel across the bulb.

CORRECT

1 / 1

1.3 Correct explanation of current flow and the function of the main components

MODEL ANSWER

A simple electric circuit provides a closed path through which electric current can flow. The battery provides the potential difference that drives current through the circuit. The switch is used to open or close the circuit.

STUDENT WROTE

"A simple electric circuit is a closed conducting path. The battery gives the potential difference that drives the current round the loop, and the switch opens or closes that path."

WHY THIS MARK

The student provides a correct explanation of the circuit as a closed path and the roles of the battery and switch.

CORRECT

1 / 1

1.4 Correctly explains the relationship between resistance and current, including the relevant principle/Ohm's law

MODEL ANSWER

According to Ohm's law, $V = IR$. If the voltage of the battery remains constant and the resistance is increased, the current flowing through the circuit decreases. Conversely, reducing the resistance allows more current to flow.

STUDENT WROTE

"By Ohm's law $V = IR$, so raising the resistance at a fixed voltage must lower the current."

WHY THIS MARK

The student correctly applies Ohm's law to explain the inverse relationship between resistance and current at a constant voltage.

CORRECT

1 / 1

1.5 Clear, logically structured explanation with appropriate labels and current direction in the diagram

MODEL ANSWER

The conventional current direction should be shown from the positive terminal of the battery through the external circuit towards the negative terminal.

STUDENT WROTE

"Conventional current moves from the positive terminal of the battery round the external circuit and back to the negative terminal."

WHY THIS MARK

The student correctly describes the direction of conventional current and provides a structured explanation with labels.

Question 2

"Technology has made information easier to access, but easier access to information does not necessarily mean better learning." Discuss this statement in detail. Write a well-structured response explaining whether you believe technology makes students better learners or makes them dependent on easily available answers. Support your argument with relevant examples, consider an opposing viewpoint, and conclude with your own reasoned opinion.

5 / 5**CORRECT****1 / 1**

2.1 Presents a clear position on whether/how technology affects learning

STUDENT WROTE

"Technology has made information far easier to reach, but reaching information is not the same as learning from it."

WHY THIS MARK

The student presents a clear position that access to information is distinct from learning.

CORRECT**1 / 1**

2.2 Provides relevant and logically developed arguments supporting the position

STUDENT WROTE

"It helps most where repetition helps: a student can replay an explanation until it works, or find a second one when the first does not work."

WHY THIS MARK

The student provides logically developed arguments regarding the benefits of technology for repetition and alternative explanations.

CORRECT**1 / 1**

2.3 Recognises and meaningfully addresses an opposing viewpoint or limitation

STUDENT WROTE

"The opposing case is that instant answers remove the struggle, and struggle is where understanding is built."

WHY THIS MARK

The student meaningfully addresses the opposing viewpoint that instant answers can hinder deep learning.

CORRECT**1 / 1**

2.4 Uses relevant examples and demonstrates reasoning rather than merely making unsupported claims

STUDENT WROTE

"When I could not follow probability in class, three different videos gave me three different angles and one of them finally made sense."

WHY THIS MARK

The student uses a relevant personal example to support their reasoning.

CORRECT**1 / 1**

2.5 Provides a coherent conclusion that follows from the discussion, with clear overall communication

STUDENT WROTE

"So my conclusion is that technology raises the ceiling and lowers the floor at once. It rewards the student who wants to understand and it excuses the student who wants to be finished."

WHY THIS MARK

The student provides a coherent and reasoned conclusion that synthesizes the previous arguments.

Question 3

The table below shows the relationship between the price of a product and the quantity demanded and supplied in a market. Price (Rs.) Quantity Demanded Quantity Supplied 10 100 20 20 80 40 30 60 60 40 40 80 50 20 100 Using the information provided, draw a properly labelled demand-and-supply graph and explain what the graph tells us about the market, including what happens when the market moves away from equilibrium and how an increase in the cost of production would affect the supply curve and the ...

5 / 5

CORRECT

1 / 1

3.1 Correctly plots and labels the demand and supply curves, with appropriate axes and direction

MODEL ANSWER

The demand and supply data can be represented on a graph with quantity on the horizontal axis and price on the vertical axis. The demand curve should slope downward from left to right... The supply curve should slope upward from left to right

STUDENT WROTE

"Quantity is on the horizontal axis and price on the vertical axis. Demand slopes downward, supply slopes upward"

WHY THIS MARK

The student correctly describes the axes and the slopes of the demand and supply curves.

CORRECT

1 / 1

3.2 Correctly identifies the equilibrium at Rs.30 and 60 units and explains why it is equilibrium

MODEL ANSWER

The two curves intersect at a price of Rs.30 and a quantity of 60 units. This point represents the market equilibrium because at this price the quantity demanded is equal to the quantity supplied.

STUDENT WROTE

"they cross at Rs 30 and 60 units, which is the equilibrium because quantity demanded equals quantity supplied there."

WHY THIS MARK

The student correctly identifies the equilibrium point and explains why it is the equilibrium.

CORRECT

1 / 1

3.3 Correctly explains shortage below equilibrium and surplus above equilibrium

MODEL ANSWER

If the market price is below the equilibrium price, quantity demanded is greater than quantity supplied. This creates a shortage... If the market price is above the equilibrium price, quantity supplied is greater than quantity demanded. This creates a surplus

STUDENT WROTE

"Below that price there is a shortage and the price is bid up; above it there is a surplus and the price is cut."

WHY THIS MARK

The student correctly explains the concepts of shortage and surplus relative to the equilibrium price.

CORRECT

1 / 1

3.4 Correctly explains that increased production costs shift the supply curve left/upward

MODEL ANSWER

If the cost of producing the product increases, production becomes less profitable at each existing price. Producers will therefore be willing to supply less at each price. The supply curve shifts to the left/upward

STUDENT WROTE

"A rise in production cost shifts the supply curve to the left"

WHY THIS MARK

The student correctly identifies that an increase in production costs shifts the supply curve to the left.

CORRECT

1 / 1

3.5 Correctly explains the resulting tendency toward a higher equilibrium price and lower equilibrium quantity, with the change represented appropriately on the graph

MODEL ANSWER

The new equilibrium would generally occur at a higher price and lower quantity, assuming demand remains unchanged.

STUDENT WROTE

"giving a higher price and a lower quantity at the new equilibrium."

WHY THIS MARK

The student correctly explains the resulting change in equilibrium price and quantity.
