Question 1 — Science (5 marks)

1.3

An electric circuit is a closed conducting path through which current can flow. The battery provides the potential difference that pushes the current around the circuit. The switch is used to open or close this path. When the switch is closed the path is complete and current flows through the resistor and the bulb; when it is open the path is broken and no current flows at all.

Feedback: The student provides a correct explanation of the circuit's nature and the functions of the battery and switch.

1.1

In my diagram the battery, switch, resistor, bulb and ammeter are all joined in one closed loop, that is, in series. The ammeter has to be in series because the current it measures is the same current that passes through the components. The voltmeter is connected in parallel across the bulb.

Feedback: The student correctly describes the series connection of the main components in a closed loop.

Feedback: The student correctly identifies the placement of the ammeter in series and the voltmeter in parallel, providing the correct reasoning for both.

because it measures the potential difference between the two ends of the bulb and not the current through it.

1.5

Conventional current is taken to flow from the positive terminal of the battery, through the switch, resistor, bulb and ammeter, and back into the negative terminal. I have marked this direction with an arrow on the diagram.

Feedback: The student correctly identifies the direction of conventional current and indicates that the diagram is properly labelled.

The current depends on the voltage and the resistance together. By Ohm's law $V = IR$, so $I = V/R$. If the battery voltage is kept the same and the resistance is increased, the current becomes smaller. If the resistance is reduced, a larger current flows. The bulb would therefore glow more dimly if I increased the resistance.

Feedback: The student correctly applies Ohm's law to explain the inverse relationship between resistance and current when voltage is constant.

Fig 1 — Series circuit with voltmeter in parallel across the bulb

Question 2 — English (5 marks)

Technology has changed how students learn because information that was once hard to reach is now available in seconds. A student can use digital libraries, videos and interactive tools to understand a concept that did not make sense in class. This makes learning flexible, because each student can go at their own pace. For example, when I could not follow a chemistry topic in class, I watched three different explanations online until one of them finally made sense to me.

Feedback: The student uses a relevant personal example to support the argument about

technology aiding conceptual understanding.

On the other hand, easy access can create dependence. A student who searches for the answer to every hard question finishes the homework but never builds the habit of working a problem out.

Feedback: The student meaningfully addresses the opposing viewpoint that technology can lead

to intellectual dependence.

There is also the risk of accepting wrong information just because it appeared on a website that looked trustworthy. Somebody who only copies is really practising searching, not thinking.

2.1

In my opinion technology does not automatically make students better or worse learners; the effect depends entirely on how it is used. It helps most when it is used to understand a concept, compare

Feedback: The student presents a clear and nuanced position on the impact of technology on

learning.

explanations and check your own work, and it harms when it replaces the effort of thinking. So I

would say technology should be treated as a tool that supports thinking rather than a substitute for it.

Feedback: The student provides a coherent conclusion that logically follows from the preceding discussion.

Question 3 — Economics (5 marks)

3.1

I have plotted quantity on the horizontal axis and price on the vertical axis. The demand curve slopes downward from left to right because consumers buy more when the price falls. The supply

Feedback: The student correctly describes the axes and the slopes of the demand and supply curves.

curve slopes upward from left to right because producers are willing to sell more when the price rises.

3.2

The two curves cross at a price of Rs 30 and a quantity of 60 units. This is the market equilibrium, because at this price quantity demanded is exactly equal to quantity supplied and there is no

Feedback: The student correctly identifies the equilibrium point and explains the condition for equilibrium.

If the market price is below Rs 30, say Rs 20, then 80 units are demanded but only 40 are supplied. This is a shortage: buyers want more than sellers will supply, so the price is pushed upward. If the price is above Rs 30, say Rs 40, then 80 units are supplied but only 40 are demanded. This is a surplus, and unsold stock pushes the price back downward. Either way the market moves back towards the equilibrium.

If the cost of production rises, producing each unit is less profitable at the old price, so producers

3.4

supply less at every price. The whole supply curve therefore shifts to the left (upward), shown as S1

Feedback: The student correctly explains that an increase in production costs shifts the supply curve to the leftward.

on my graph. Assuming demand does not change, the new equilibrium is at a higher price and a lower quantity than before.

3.5

Feedback: The student correctly identifies the effect of the supply shift on the new equilibrium price and quantity.

Fig 2 — Demand and supply, with the supply curve after a cost increase

15 / 15 (100.0%)

Question 1

Explain how a simple electric circuit works and illustrate your explanation with a properly labelled circuit diagram showing a battery, switch, bulb, resistor, ammeter and voltmeter. Your answer should explain how the components are connected, the path followed by electric current, and how changing the resistance affects the current flowing through the circuit.

5 / 5

CORRECT

1 / 1

1.1 Correctly represents the main circuit with battery, switch, bulb and resistor connected in a closed series path

MODEL ANSWER

A properly labelled diagram would therefore show the battery connected to the switch, resistor, bulb and ammeter in a single closed loop

STUDENT WROTE

"In my diagram the battery, switch, resistor, bulb and ammeter are all joined in one closed loop, that is, in series."

WHY THIS MARK

The student correctly describes the series connection of the main components in a closed loop.

CORRECT

1 / 1

1.2 Correct placement of ammeter in series and voltmeter in parallel across the bulb

MODEL ANSWER

The ammeter must be connected in series because it measures the current flowing through the circuit. A voltmeter, however, should be connected in parallel across the bulb, because it measures the potential difference between the two ends of the bulb.

STUDENT WROTE

"The ammeter has to be in series because the current it measures is the same current that passes through the components. The voltmeter is connected in parallel across the bulb"

WHY THIS MARK

The student correctly identifies the placement of the ammeter in series and the voltmeter in parallel, providing the correct reasoning for both.

CORRECT

1 / 1

1.3 Correct explanation of current flow and the function of the main components

MODEL ANSWER

A simple electric circuit provides a closed path through which electric current can flow. The battery provides the potential difference that drives current through the circuit. The switch is used to open or close the circuit.

STUDENT WROTE

"An electric circuit is a closed conducting path through which current can flow. The battery provides the potential difference that pushes the current around the circuit. The switch is used to open or close this path."

WHY THIS MARK

The student provides a correct explanation of the circuit's nature and the functions of the battery and switch.

CORRECT

1 / 1

1.4 Correctly explains the relationship between resistance and current, including the relevant principle/Ohm's law

MODEL ANSWER

According to Ohm's law, $V = IR$. If the voltage of the battery remains constant and the resistance is increased, the current flowing through the circuit decreases. Conversely, reducing the resistance allows more current to flow.

STUDENT WROTE

"By Ohm's law $V = IR$, so $I = V/R$. If the battery voltage is kept the same and the resistance is increased, the current becomes smaller. If the resistance is reduced, a larger current flows."

WHY THIS MARK

The student correctly applies Ohm's law to explain the inverse relationship between resistance and current when voltage is constant.

CORRECT

1 / 1

1.5 Clear, logically structured explanation with appropriate labels and current direction in the diagram

MODEL ANSWER

The conventional current direction should be shown from the positive terminal of the battery through the external circuit towards the negative terminal.

STUDENT WROTE

"Conventional current is taken to flow from the positive terminal of the battery, through the switch, resistor, bulb and ammeter, and back into the negative terminal. I have marked this direction with an arrow on the diagram."

WHY THIS MARK

The student correctly identifies the direction of conventional current and indicates that the diagram is properly labelled.

Question 2

"Technology has made information easier to access, but easier access to information does not necessarily mean better learning."

Discuss this statement in detail. Write a well-structured response explaining whether you believe technology makes students better learners or makes them dependent on easily available answers. Support your argument with relevant examples, consider an opposing viewpoint, and conclude with your own reasoned opinion.

5 / 5

CORRECT

1 / 1

2.1 Presents a clear position on whether/how technology affects learning

STUDENT WROTE

"In my opinion technology does not automatically make students better or worse learners; the effect depends entirely on how it is used."

WHY THIS MARK

The student presents a clear and nuanced position on the impact of technology on learning.

CORRECT

1 / 1

2.2 Provides relevant and logically developed arguments supporting the position

STUDENT WROTE

"This makes learning flexible, because each student can go at their own pace... On the other hand, easy access can create dependence."

WHY THIS MARK

The student develops logical arguments regarding both the benefits (flexibility) and drawbacks (dependence) of technology.

CORRECT

1 / 1

2.3 Recognises and meaningfully addresses an opposing viewpoint or limitation

STUDENT WROTE

"On the other hand, easy access can create dependence. A student who searches for the answer to every hard question finishes the homework but never builds the habit of working a problem out."

WHY THIS MARK

The student meaningfully addresses the opposing viewpoint that technology can lead to intellectual dependence.

CORRECT

1 / 1

2.4 Uses relevant examples and demonstrates reasoning rather than merely making unsupported claims

STUDENT WROTE

"For example, when I could not follow a chemistry topic in class, I watched three different explanations online until one of them finally made sense to me."

WHY THIS MARK

The student uses a relevant personal example to support the argument about technology aiding conceptual understanding.

CORRECT

1 / 1

2.5 Provides a coherent conclusion that follows from the discussion, with clear overall communication

STUDENT WROTE

"So I would say technology should be treated as a tool that supports thinking rather than a substitute for it."

WHY THIS MARK

The student provides a coherent conclusion that logically follows from the preceding discussion.

Question 3

The table below shows the relationship between the price of a product and the quantity demanded and supplied in a market. Price (Rs.) Quantity Demanded Quantity Supplied 10 100 20 20 80 40 30 60 60 40 40 80 50 20 100 Using the information provided, draw a properly labelled demand-and-supply graph and explain what the graph tells us about the market, including what happens when the market moves away from equilibrium and how an increase in the cost of production would affect the supply curve and the ...

CORRECT

1 / 1

3.1 Correctly plots and labels the demand and supply curves, with appropriate axes and direction

MODEL ANSWER

The demand and supply data can be represented on a graph with quantity on the horizontal axis and price on the vertical axis. The demand curve should slope downward from left to right... The supply curve should slope upward from left to right

STUDENT WROTE

"I have plotted quantity on the horizontal axis and price on the vertical axis. The demand curve slopes downward from left to right... The supply curve slopes upward from left to right"

WHY THIS MARK

The student correctly describes the axes and the slopes of the demand and supply curves.

CORRECT

1 / 1

3.2 Correctly identifies the equilibrium at Rs.30 and 60 units and explains why it is equilibrium

MODEL ANSWER

The two curves intersect at a price of Rs.30 and a quantity of 60 units. This point represents the market equilibrium because at this price the quantity demanded is equal to the quantity supplied.

STUDENT WROTE

"The two curves cross at a price of Rs 30 and a quantity of 60 units. This is the market equilibrium, because at this price quantity demanded is exactly equal to quantity supplied"

WHY THIS MARK

The student correctly identifies the equilibrium point and explains the condition for equilibrium.

CORRECT

1 / 1

3.3 Correctly explains shortage below equilibrium and surplus above equilibrium

MODEL ANSWER

If the market price is below the equilibrium price, quantity demanded is greater than quantity supplied. This creates a shortage... If the market price is above the equilibrium price, quantity supplied is greater than quantity demanded. This creates a surplus

STUDENT WROTE

"If the market price is below Rs 30... This is a shortage... If the price is above Rs 30... This is a surplus"

WHY THIS MARK

The student correctly explains the concepts of shortage and surplus when the market is not at equilibrium.

CORRECT

1 / 1

3.4 Correctly explains that increased production costs shift the supply curve left/upward

MODEL ANSWER

If the cost of producing the product increases, production becomes less profitable at each existing price. Producers will therefore be willing to supply less at each price. The supply curve shifts to the left/upward

STUDENT WROTE

"If the cost of production rises... The whole supply curve therefore shifts to the left (upward), shown as S1 on my graph."

WHY THIS MARK

The student correctly explains that an increase in production costs shifts the supply curve to the left/upward.

CORRECT

1 / 1

3.5 Correctly explains the resulting tendency toward a higher equilibrium price and lower equilibrium quantity, with the change represented appropriately on the graph

MODEL ANSWER

The new equilibrium would generally occur at a higher price and lower quantity, assuming demand remains unchanged.

STUDENT WROTE

"Assuming demand does not change, the new equilibrium is at a higher price and a lower quantity than before."

WHY THIS MARK

The student correctly identifies the effect of the supply shift on the new equilibrium price and quantity.
